

Language Identification from Speech

Sam Sucik

MInf Project (Part 1) Report

Master of Informatics
School of Informatics
University of Edinburgh

2019

Abstract

This is an example of `infthesis` style. The file `skeleton.tex` generates this document and can be used to get a “skeleton” for your thesis. The abstract should summarise your report and fit in the space on the first page. You may, of course, use any other software to write your report, as long as you follow the same style. That means: producing a title page as given here, and including a table of contents and bibliography.

Acknowledgements

Acknowledgements go here.

Table of Contents

| | | |
|----------|--------------------------|-----------|
| 1 | Introduction | 7 |
| 1.1 | Using Sections | 7 |
| 1.2 | Citations | 7 |
| 1.3 | Options | 8 |
| 2 | The Real Thing | 9 |
| 3 | Features | 11 |
| | Bibliography | 13 |

Chapter 1

Introduction

The document structure should include:

- The title page in the format used above.
- An optional acknowledgements page.
- The table of contents.
- The report text divided into chapters as appropriate.
- The bibliography.

Commands for generating the title page appear in the skeleton file and are self explanatory. The file also includes commands to choose your report type (project report, thesis or dissertation) and degree. These will be placed in the appropriate place in the title page.

The default behaviour of the documentclass is to produce documents typeset in 12 point. Regardless of the formatting system you use, it is recommended that you submit your thesis printed (or copied) double sided.

The report should be printed single-spaced. It should be 30 to 60 pages long, and preferably no shorter than 20 pages. Appendices are in addition to this and you should place detail here which may be too much or not strictly necessary when reading the relevant section.

1.1 Using Sections

Divide your chapters into sub-parts as appropriate.

1.2 Citations

Note that citations (like ? or ?) can be generated using BibTeX or by using the

thebibliography environment. This makes sure that the table of contents includes an entry for the bibliography. Of course you may use any other method as well.

1.3 Options

There are various documentclass options, see the documentation. Here we are using an option (`bsc` or `minf`) to choose the degree type, plus:

- `frontabs` (recommended) to put the abstract on the front page;
- `twoside` (recommended) to format for two-sided printing, with each chapter starting on a right-hand page;
- `singlespacing` (required) for single-spaced formatting; and
- `parskip` (a matter of taste) which alters the paragraph formatting so that paragraphs are separated by a vertical space, and there is no indentation at the start of each paragraph.

Chapter 2

The Real Thing

Of course you may want to use several chapters and much more text than here.

Chapter 3

Features

Various features used in the past in LID experiments:

1. Shifted delta cepstra (SDC) by Ferrer et al. (2016)
2. 39D MFCC vectors combined with 4D pitch features (Song et al., 2013)
3. 39 PLP features (including Δ and $\Delta\Delta$) (Lopez-Moreno et al., 2014)
4. Lin and Wang (2005) do LID just from the pitch contour parametrised by Legendre polynomials
5. Ghahremani et al. (2014) show ASR improvements with a pitch-tracking algorithm that calculates pitch even for unvoiced frames
